

AVOIDING DAMAGE CAUSED BY DAMP

High levels of humidity lead to damp patches in the property, particularly in the bathroom, kitchen or even in the bedroom. What should I do if the property seems to be permanently damp?

If you heat and air the property correctly, this will always be of benefit. On the one hand, you avoid damage to the property and, on the other hand, you are boosting your health. We know that there are always exceptions to any rule. However, all in all, we recommend that you follow our advice to effectively prevent damage caused by damp in the property.

- » Even rooms which are not used all the time should not be allowed to get completely chilled through but should instead be heated sufficiently. This is important to ensure that there is no moisture building up. Do not turn the heating off completely when you leave the property.
- » Do not place your furniture too near to the wall or heating (radiators). The radiators should also not be covered with a curtain.
- » Keep the doors to unheated rooms closed.
- » Try and create a slight draught. A few minutes draught are enough to replace stale air with dry fresh air. Avoid permanent ventilation of the property.
